Senior Backend Engineer - E-commerce Platform (Remote)

C#/.NET | Complex integrations | Event-driven architecture

Summary

For our client, we are searching for a **Senior Backend Engineer – E-commerce Platform** .

Here is a summary if you are short on time and want to know whether the position matches your expertise and offers you the technical challenges you are looking for. Below you will find an extensive description of the company, team, culture and technology stack.

Currently, development of the e-commerce platform is partly outsourced to an external agency. Our client is building an in-house engineering team that will take over the development and maintenance of the webshop and its underlying platform.

The company has **8,000+ products in stock** , sells across Europe from the Netherlands, was founded in 2016 and employs 100+ people.

By the end of 2026, e-commerce development needs to be handled by the in-house engineering team. The team is expected to consist in the short term of approximately **2 frontend engineers, 2 backend engineers and an Engineering Team Lead** .

As Senior Backend Engineer, you will be one of the key engineers working on the **technical core of the platform** . Your main responsibility is developing and extending the custom **.NET/C# integration layer** and ensuring reliable communication and data flows between the different systems.

This is a **hands-on senior engineering position** . You do not need experience leading or managing a team. We do, however, expect senior-level technical ownership, problem-solving ability and the capability to contribute to architectural decisions.

The client uses a modern digital commerce platform designed for scalability, flexibility, speed to market and omnichannel growth. The platform consists of **BigCommerce, NetSuite, Akeneo, Prismic, Channable and Klaviyo** . The custom integration layer is developed in .**NET (C#)** . The frontend uses **React, Redux and Tailwind CSS** . Hosting is across **Azure and Fly.io** .

Hiring: Full-time, long term
Location: Fully remote
Timezone: CET ±2

Summary of requirements

Strong senior-level experience as a backend software engineer in .NET/C#. You will work extensively on the custom integration layer connecting the different systems of the e-commerce platform.

Experience with e-commerce platforms. Experience with BigCommerce is a strong plus. If you have not worked with BigCommerce, we are looking for experience with comparable platforms such as Magento/ Adobe Commerce, Shopify/Shopify Plus, Salesforce Commerce Cloud, commercetools or similar platforms.

Experience integrating different business systems with an e-commerce platform. The current environment includes:

* NetSuite – ERP
* Akeneo – PIM
* Prismic – headless CMS
* Channable – multichannel/feed management
* Klaviyo – marketing automation/CDP

You do not need experience with all these specific products. What is important is that you have worked with **comparable ERP, PIM, CMS, feed-management and marketing-automation systems** and understand how they exchange data with an e-commerce platform.

Strong experience with APIs and integration architecture. You should be experienced in designing and building REST APIs and third-party integrations and understand how to create reliable integrations between multiple business-critical systems.

Experience with event-driven architecture and message brokers. You should understand asynchronous processing and concepts such as queues, retries, idempotency, duplicate-message handling, dead-letter queues, eventual consistency and failure recovery. Experience with RabbitMQ, Kafka, Azure Service Bus or comparable technologies is relevant.

Experience with PostgreSQL and database/storage technologies. You should have a solid understanding of choosing appropriate SQL, NoSQL and storage technologies for different technical requirements.

Strong Azure experience is required. The platform is hosted across Azure and Fly.io. Experience with Fly.io is not mandatory if you have experience with comparable cloud/container platforms. Experience with CI/CD and containerisation is also important.

Experience with automated testing , including unit, integration and end-to-end testing, and an understanding of maintainable and testable backend architecture.

You should have experience with the underlying **business processes of an e-commerce platform** , particularly:

* Orders and transaction processing
* Payments and PSP integrations
* Inventory and stock synchronisation
* Pricing
* Product information
* ERP synchronisation
* Multichannel/marketplace data flows

* Security and reliable processing of transactional data

Understanding **how data flows through the complete platform** is particularly important. You should be able to reason about situations where one system is temporarily unavailable, messages are duplicated, a payment succeeds while another system fails, or inventory changes simultaneously across different sales channels.

You will work closely with the **Engineering Lead, Product Owner, frontend engineers and other backend engineers** . You therefore need to communicate technical issues clearly and proactively with different stakeholders.

Experience with **React, Redux and Tailwind CSS** is beneficial because this is the frontend stack, but you do not need to be a senior frontend engineer.

Experience with **A/B testing and conversion optimisation** is beneficial because the engineering team works closely with the Product Owner on continuously improving the e-commerce platform, but it is not a core requirement for this backend position.

English: preferably fluent; intermediate+ (B2–C1) is the minimum required level.

You are an **active communicator** . This means you do not wait for problems to escalate but proactively communicate with engineers, the Product Owner and other stakeholders when information, decisions or action are required.

Experience working in **e-commerce or another high-volume transactional environment** is strongly preferred. Relevant environments include e-commerce webshops selling products from stock and warehouses, online food delivery, marketplaces, leisure/events and ticketing platforms, or other platforms involving complex orders, payments and transactions.

Important

We are **not simply looking for an experienced .NET developer** .

We are looking for a senior backend engineer who understands how complex systems interact in a modern e-commerce environment and can design backend services and integrations that remain reliable when things go wrong.

Your seniority should be demonstrated through your **technical judgement, architecture understanding, integration experience, problem-solving ability and ownership of production software** — not through people-management experience.

When we talk about years of experience, we mean actual professional/project experience in production environments.

If you are a **full-stack engineer with particularly strong .NET/backend expertise** , we would also like you to consider this position. If your expertise is primarily frontend development, this position will not be the right match, although we may have separate frontend opportunities.

Full descripion position

About the company

The company is a Dutch e-commerce company selling 8000+ products from their warehouse since 2016. They have grown in 9 years to a profitable multi country business with a turnover Eur 25+ million. Selling hardware for the do it yourself (DIY) construction market.
They deliver A-quality hardware from own warehouse, at sharp prices and backed by customer service. What sets them apart are reliability of products, a webshop built for ease, fast and reliable delivery and knowledge and support that inspires their customers.

They hired an agency to build the webshop from scratch. They started 2026 with the goal to build up an e-commerce development team in house to speed up development and conversion optimization.
The development of the webshop should be transferred from the agency to the in-house team before the end of 2026.

Currently our client is using a best-in-class modern digital commerce stack designed for platform scalability, flexibility, speed to market, and omnichannel growth. Consisting of BigCommerce, Netsuite, Akaneo, Prismic, Channable, Klaviyo. The custom integration layer is in .Net (C#). For frontend React, Redux and Tailwind is in place.

The company employs 100+ people and is growing fast. They double every 2-3 years in turnover and their challenge is to build an experienced ecommerce engineering team. The webshop is operated in 12 languages, selling in more than 12 countries. They have the financial resources to extend services on the platform and invest in new.

About the e-commerce development team

They are building the engineering team since 5 months. Currently they have 2 frontend engineers, a projectmanager (PO) and a Engineering lead (specialized in Backend). The Team is expect to hire the coming year additional experienced engineers (ed QA, Frontend and backend).
The team is expected to be fully remote. The team is supported by an experienced CTO helping them to set up the team and remote processes.

TechTalent4Growth bv is the preferred partner for hiring engineers and helping them to built their remote team.

Keep an eye on our website and socials for other positions the coming period.

The position

We are looking for a Senior Backend Engineer (5+ years experience) to replace dependencies of the external agency and built the in-house engineering team further.

The company is bringing the development and maintenance of its e-commerce platform in-house. At the heart of this platform is a custom .NET/C# integration layer connecting the webshop with ERP, PIM, CMS, feed management, marketing automation, payment providers and other business-critical systems.

As Senior Backend Engineer, you will work on this technical core. You will design, build and improve reliable integrations and backend services that support orders, payments, inventory, pricing, product information and other critical e-commerce processes.

This is a hands-on senior engineering position. You don't need experience managing or leading a team. However, we do expect you to take ownership of complex technical problems and contribute to architectural and engineering decisions.

The technical environment

- **Backend:** C# / .NET
- **E-commerce:** BigCommerce
- **ERP:** NetSuite
- **PIM:** Akeneo
- **CMS:** Prismic
- **Feed management:** Channable
- **Marketing automation:** Klaviyo
- **Frontend:** React, Redux and Tailwind CSS
- **Database:** PostgreSQL
- **Cloud & hosting:** Azure and Fly.io
- **Integrations:** REST APIs, third-party APIs and event-driven/asynchronous communication
- **Messaging:** Message brokers and queue-based processing
- **Payments:** PSP/payment integrations

Previous experience with these individual platforms would be highly beneficial. However experience integrating comparable ERP, PIM, CMS, commerce or marketing systems is equally relevant.

What you will do

You will develop and maintain the backend and integration architecture connecting the different parts of the e-commerce landscape. A significant part of your work involves ensuring that data remains reliable when multiple systems communicate asynchronously.

- Develop backend services and integrations using C# and .NET.
- Design and maintain APIs and integrations between BigCommerce, ERP, PIM, CMS, marketing, feed and payment systems.
- Work with event-driven and asynchronous architectures.
- Design reliable message-processing flows using queues/message brokers.

- Handle idempotency, retries, duplicate messages, dead-letter queues, eventual consistency and failure recovery.
- Build reliable order, inventory, pricing, payment and product-data synchronization.
- Investigate and resolve complex production issues involving multiple interconnected systems.
- Improve monitoring, logging and observability so problems can be identified and diagnosed quickly.
- Contribute to testing, code quality, security and CI/CD/deployment practices.
- Contribute to architectural decisions and continuously improve platform scalability and reliability.
- Work closely with the Engineering Lead, Product Owner, frontend engineers and other backend/full-stack engineers.

What we are looking for

We are looking for an experienced backend engineer with strong C#/.NET expertise and, importantly, experience beyond building standalone applications. You understand what happens when multiple business-critical systems have to work together.

- Professional C#/.NET backend development in production environments.
- Designing and developing APIs and integration layers.
- Event-driven architecture and distributed systems.
- Message brokers such as RabbitMQ, Kafka, Azure Service Bus or comparable technologies.
- Asynchronous processing and concepts such as retries, idempotency, dead-letter handling and eventual consistency.
- Integrating complex third-party systems.
- Databases such as PostgreSQL and data modelling for transactional applications.
- Monitoring, logging, troubleshooting and production reliability.
- Automated testing and maintainable software architecture.

Experience with e-commerce or another high-volume transactional environment is strongly preferred.

Ideally, you have worked with integrations involving:

- ERP systems
- PIM systems
- Payment providers / PSPs

- E-commerce platforms
- Inventory and stock management
- Feed or marketplace integrations
- Marketing automation
- CMS platforms

Experience with BigCommerce, NetSuite, Akeneo, Prismic, Channable or Klaviyo is an advantage, but comparable platforms are also relevant.

Soft skills

What is important besides your technical expertise is your soft skills. You are an active listener meaning you are familiar with asking questions to get to know what is required and you understand when your team members need help, not only when they ask you for it.

You have good communication skills (orally and written). You are experienced in working remote for English speaking customers. You know you better communicate too much than too little, with your team, to deliver your part of the platform.

English level

Your level of English conversation is intermediate+. You need to be able to discuss in English your ideas, proposals with your team, the CTO and stakeholders. If this is a problem you donot have the required level in English. Further you are a person who is curious and eager to learn and you take initiative. You are easy in connecting and collaborating with other team members.

What makes this role different

We are not simply looking for a senior .NET developer.

The complexity of this position lies in understanding the interaction between multiple systems. For example: What happens when a customer successfully pays but the ERP is temporarily unavailable? How do you prevent the same order from being processed twice? What happens when inventory changes simultaneously in the ERP, webshop and marketplaces? How do you recover when one part of a multi-system process fails?

You should be comfortable analysing these situations and designing solutions that remain reliable under real-world conditions.

You don't need to manage people or lead the engineering team. Your seniority should primarily show in your technical judgement, architecture understanding, problem-solving ability and ownership of production software.

What my client offers

The client is growing fast. With such fast growth plenty of opportunities arise. So if you want to increase your e-commerce experience further and take responsibility working with a composable architecture, building a high conversion e-commerce platform, you should definitely respond.
Flexible working: the position is for remote work.

The Hiring process

1. Interview with the recruiter TechTalent4Growth bv (45 min)
2. Technical assignment where your Tech experience and insights are tested. The Tech assignment is reviewed by the Engineering Lead and the manager. (Tech assignment takes up to 4 hours)
3. Discuss assignment and findings with head of engineering and the CTO (1 hour)
Meet your potential colleagues.
4.interview with Productowner about way of working and time for final questions from your side.
5. Contract

The contract

- Permanent contract (fulltime hire).
- 3 month trial period (2 payments/month)
- After trial period 1 month notice (1 payment/month)
- Payment is net (Bank transfer costs are paid for by TechTalent4Growth bv)

About TechTalent4Growth

TechTalent4Growth is empowering European and MENA Tech experts to work remote and connect to fast growing European Tech companies. We work with independent, experienced software engineers in different countries. We have a human approach: we are open, frendly with an data driven mind and respect for every individual!

Kindness results in safe conversations, environments which is an enabler to search for qualities and competences. This is how we can match people and company cultures.
We are thorough, our customized processes helps us gather the data needed to filter experience, attitude and skills.
Our systems helps to dig deeper and let people unlock (hidden) potential and offer companies talent that fit their culture and fuel their growth.

Disclaimer: We hire specifically from countries within our cultural fit zone and Time zone. This includes engineers from Europe and its borders (MENA region). Outside this zone the culture gaps are to large.This includes Asian countries like India, China. Please respect our choices and try to understand why we do this.
